# JavaScript String Methods

[◀ Previous](#)[Next ▶](#)

String methods help you to work with strings.

## String Methods and Properties

Primitive values, like "John Doe", cannot have properties or methods (because they are not objects).

But with JavaScript, methods and properties are also available to primitive values, because JavaScript treats primitive values as objects when executing methods and properties.

## JavaScript String Length

The **length** property returns the length of a string:

### Example

```
let txt = "ABCDEFGHIJKLMNOPQRSTUVWXYZ";  
let length = txt.length;
```

[Try it Yourself »](#)

# Extracting String Parts

There are 3 methods for extracting a part of a string:

- `slice(start, end)`
- `substring(start, end)`
- `substr(start, length)`

## JavaScript String slice()

`slice()` extracts a part of a string and returns the extracted part in a new string.

The method takes 2 parameters: the start position, and the end position (end not included).

This example slices out a portion of a string from position 7 to position 12 (13-1):

### Example

```
let str = "Apple, Banana, Kiwi";  
let part = str.slice(7, 13);
```

**Try it Yourself »**

## Note

JavaScript counts positions from zero.

First position is 0.

Second position is 1.

If a parameter is negative, the position is counted from the end of the string.

This example slices out a portion of a string from position -12 to position -6:

## Example

```
let str = "Apple, Banana, Kiwi";  
let part = str.slice(-12, -6);
```

[Try it Yourself »](#)

If you omit the second parameter, the method will slice out the rest of the string:

## Example

```
let part = str.slice(7);
```

[Try it Yourself »](#)

or, counting from the end:

## Example

```
let part = str.slice(-12);
```

[Try it Yourself »](#)

---

# JavaScript String substring()

`substring()` is similar to `slice()`.

The difference is that `substring()` cannot accept negative indexes.

## Example

```
let str = "Apple, Banana, Kiwi";  
let part = str.substring(7, 13);
```

[Try it Yourself »](#)

If you omit the second parameter, `substring()` will slice out the rest of the string.

---

## JavaScript String substr()

`substr()` is similar to `slice()`.

The difference is that the second parameter specifies the **length** of the extracted part.

## Example

```
let str = "Apple, Banana, Kiwi";  
let part = str.substr(7, 6);
```

[Try it Yourself »](#)

If you omit the second parameter, `substr()` will slice out the rest of the string.

## Example

```
let str = "Apple, Banana, Kiwi";  
let part = str.substr(7);
```

Try it Yourself »

If the first parameter is negative, the position counts from the end of the string.

## Example

```
let str = "Apple, Banana, Kiwi";  
let part = str.substr(-4);
```

Try it Yourself »

---

## Replacing String Content

The `replace()` method replaces a specified value with another value in a string:

## Example

```
let text = "Please visit Microsoft!";  
let newText = text.replace("Microsoft", "W3Schools");
```

Try it Yourself »

## Note

The `replace()` method does not change the string it is called on.

The `replace()` method returns a new string.

By default, the `replace()` method replaces **only the first** match:

## Example

```
let text = "Please visit Microsoft and Microsoft!";  
let newText = text.replace("Microsoft", "W3Schools");
```

[Try it Yourself »](#)

By default, the `replace()` method is case sensitive. Writing MICROSOFT (with upper-case) will not work:

## Example

```
let text = "Please visit Microsoft!";  
let newText = text.replace("MICROSOFT", "W3Schools");
```

[Try it Yourself »](#)

To replace case insensitive, use a **regular expression** with an `/i` flag (insensitive):

## Example

```
let text = "Please visit Microsoft!";  
let newText = text.replace(/MICROSOFT/i, "W3Schools");
```

[Try it Yourself »](#)

## Note

Regular expressions are written without quotes.

To replace all matches, use a **regular expression** with a `/g` flag (global match):

## Example

```
let text = "Please visit Microsoft and Microsoft!";  
let newText = text.replace(/Microsoft/g, "W3Schools");
```

[Try it Yourself »](#)

## Note

You will learn a lot more about regular expressions in the chapter [JavaScript Regular Expressions](#).

---

## Converting to Upper and Lower Case

A string is converted to upper case with `toUpperCase()` :

A string is converted to lower case with `toLowerCase()` :

---

## JavaScript String toUpperCase()

### Example

```
let text1 = "Hello World!";  
let text2 = text1.toUpperCase();
```

[Try it Yourself »](#)

## JavaScript String toLowerCase()

## Example

```
let text1 = "Hello World!";      // String
let text2 = text1.toLowerCase(); // text2 is text1 converted to
lower
```

[Try it Yourself »](#)

---

## JavaScript String concat()

`concat()` joins two or more strings:

### Example

```
let text1 = "Hello";
let text2 = "World";
let text3 = text1.concat(" ", text2);
```

[Try it Yourself »](#)

The `concat()` method can be used instead of the plus operator. These two lines do the same:

### Example

```
text = "Hello" + " " + "World!";
text = "Hello".concat(" ", "World!");
```

## Note

All string methods return a new string. They don't modify the original string.

Formally said:

Strings are immutable: Strings cannot be changed, only replaced.

---

## JavaScript String trim()

The `trim()` method removes whitespace from both sides of a string:

### Example

```
let text1 = "    Hello World!    ";  
let text2 = text1.trim();
```

[Try it Yourself »](#)

---

## JavaScript String Padding

ECMAScript 2017 added two String methods: `padStart` and `padEnd` to support padding at the beginning and at the end of a string.

---

## JavaScript String padStart()

### Example

```
let text = "5";  
let padded = text.padStart(4,0);
```

[Try it Yourself »](#)

## Browser Support

`padStart()` is an ECMAScript 2017 feature.

It is supported in all modern browsers:

Chrome	Edge	Firefox	Safari	Opera
Yes	Yes	Yes	Yes	Yes

`padStart()` is not supported in Internet Explorer.

## JavaScript String `padEnd()`

### Example

```
let text = "5";  
let padded = text.padEnd(4,0);
```

[Try it Yourself »](#)

## Browser Support

`padEnd()` is an ECMAScript 2017 feature.

It is supported in all modern browsers:

Chrome	Edge	Firefox	Safari	Opera
Yes	Yes	Yes	Yes	Yes

`padEnd()` is not supported in Internet Explorer.

## Extracting String Characters

There are 3 methods for extracting string characters:

- `charAt(position)`
- `charCodeAt(position)`
- Property access [ ]

---

## JavaScript String charAt()

The `charAt()` method returns the character at a specified index (position) in a string:

### Example

```
let text = "HELLO WORLD";  
let char = text.charAt(0);
```

**Try it Yourself »**

---

## JavaScript String charCodeAt()

The `charCodeAt()` method returns the unicode of the character at a specified index in a string:

The method returns a UTF-16 code (an integer between 0 and 65535).

### Example

```
let text = "HELLO WORLD";  
let char = text.charCodeAt(0);
```

**Try it Yourself »**

# Property Access

ECMAScript 5 (2009) allows property access [ ] on strings:

## Example

```
let text = "HELLO WORLD";  
let char = text[0];
```

[Try it Yourself »](#)

## Note

Property access might be a little **unpredictable**:

- It makes strings look like arrays (but they are not)
- If no character is found, [ ] returns undefined, while charAt() returns an empty string.
- It is read only. str[0] = "A" gives no error (but does not work!)

## Example

```
let text = "HELLO WORLD";  
text[0] = "A";    // Gives no error, but does not work
```

[Try it Yourself »](#)

---

## Converting a String to an Array

If you want to work with a string as an array, you can convert it to an array.

## JavaScript String split()

A string can be converted to an array with the `split()` method:

### Example

```
text.split(",")    // Split on commas  
text.split(" ")    // Split on spaces  
text.split("|")    // Split on pipe
```

**Try it Yourself »**

If the separator is omitted, the returned array will contain the whole string in index [0].

If the separator is "", the returned array will be an array of single characters:

### Example

```
text.split("")
```

**Try it Yourself »**

## Complete String Reference

For a complete String reference, go to our:

[Complete JavaScript String Reference.](#)

The reference contains descriptions and examples of all string properties and

methods.

## Test Yourself With Exercises

### Exercise:

Convert the text into an UPPERCASE text:

```
let txt = "Hello World!";  
txt = txt.           ;
```
